Preface *vii*
Syllabus *xv*
Syllabus comparison *xvii*
Symbols used *xix*

1. SIMPLE STRESSES AND STRAINS **1–68**

1.1 Introduction *1*
1.2 Loads *2*
1.3 Stress *2*
1.4 Strain (ε) *3*
1.5 Hooke's law *4*
1.6 Stress-strain diagram *4*
1.7 Factor of safety (*n*) *6*
1.8 Mechanical properties of materials *7*
1.9 Difference between ductile and brittle materials *8*
1.10 True stress and true strain *8*
1.11 Deformation in bars of varying cross-section *14*
1.12 Deformation in bars of uniformly tapering rectangular cross-section (bar) *20*
1.13 Deformation in bars of uniformly tapering circular cross-section (rod) *21*
1.14 Elongation of a bar due to self weight *28*
1.15 Deformation of a bar of uniform strength *29*
1.16 Principle of superposition *30*
1.17 Indeterminate systems *46*
1.18 Difference between determinate and indeterminate structures *46*
VTU Question Papers ***56***

2. STRESSES IN COMPOSITE SECTIONS **69–149**

2.1 Composite/compound bars *69*
2.2 Volumetric strain *93*
2.2.1 Derivation of volumetric strain for a single direct stress *93*
2.2.2 Derivation of volumetric strain for 3 direct stresses *95*
2.3 Upper limit of poisson's ratio *96*
2.4 Elastic constants *103*
2.5 Relation among elastic constants *104*
2.5.1 Relation between Young's modulus (E) and modulus of rigidity (G) *104*
2.5.2 Relation between Young's modulus (E) and Bulk modulus (K) *105*
2.5.3 Relation between Young's modulus, modulus of rigidity and Bulk modulus *106*
2.6 Shear stress and shear strain *110*
2.7 Thermal or temperature stresses and strains *112*

2.8 Thermal stresses in compound bars *116*
2.9 Thermal stresses in bars of varying cross-section 133
VTU Question Papers *139*

3. COMPOUND STRESSES OR ANALYSIS OF STRESS AND STRAIN 150–222

3.1 Introduction *150*
3.2 Plane stress *151*
3.2.1 Stress tensor or components of stress *151*
3.2.2 Sign convention *152*
3.2.3 Notation of stress *152*
3.3 Methods of stress determination *153*
3.4 Stresses on an inclined plane subjected to uniaxial stresses *153*
3.5 Stresses on an inclined plane subjected to biaxial stresses *154*
3.6 Stresses due to pure shearing *156*
3.7 General two-dimensional stress system or plane stress system *157*
Principal Stresses *159*
Application of principal stresses *163*
Problems on uniaxial stress *163*
Problems on biaxial stress *165*
Problems on pure shear stress *167*
Problems on generalized stress system *167*
3.8 Graphical solution – Mohr's circle method *197*
3.8.1 Mohr's circle for two mutually perpendicular like stresses *197*
3.8.2 Mohr's circle for two mutually perpendicular unlike stresses *198*
3.8.3 Mohr's circle for general two-dimensional stress system or plane stress system *199*
VTU Question Papers *212*

4. THICK AND THIN CYLINDERS 223–254

4.1 Introduction *223*
4.2 Thin cylindrical shells subjected to internal pressure *224*
4.2.1 Circumferential or hoop or tangential stress *224*
4.2.2 Longitudinal or axial stress *225*
4.2.3 Maximum shear stress *225*
4.3 Change in dimension of a thin cylindrical shell subjected to internal pressure *225*
4.4 Thick cylinders *232*
4.5 Lame's theory *233*
4.6 Difference between thick and thin cylinders *235*
Problems on stresses *236*
Problems on thickness *241*
Problems on pressure *244*
VTU Question Papers *249*

5. SHEAR FORCES AND BENDING MOMENTS 255–344

5.1 Introduction *256*
5.2 Types of beams *256*
5.3 Types of supports *257*
5.4 Types of loading *257*
5.5 Definitions *258*

5.6 Sign convention *258*
5.7 Relationship between loading, shear force and bending moments *259*
5.8 Standard cases of a cantilever beam *260*
5.8.1 Cantilever beam with a point load at its free end *260*
5.8.2 Cantilever with uniformly distributed load over entire span *260*
5.8.3 Cantilever beam carrying a uniformly varying load from zero at free end to w/unit length at fixed end *261*
5.8.4 Cantilever beam carrying a uniformly varying load from zero at fixed end to w/unit length at free end *263*
5.8.5 Cantilever beam subjected to couple *264*
5.9 Standard cases of a simply supported beam (SSB) *278*
5.9.1 Simply supported beam with a point load at mid-span *278*
5.9.2 Simply supported beam with an eccentric point load *279*
5.9.3 Simply supported beam with a uniformly distributed load over entire span *281*
5.9.4 Simply supported beam carrying a UVL from zero at one end to w/unit length at other end *283*
5.9.5 Simply supported beam carrying a uniformly varying load from zero at both ends to w/unit length at the centre *285*
5.9.6 Simply supported beam subjected to couple at mid-span *287*
5.10 Standard cases of an overhanging beam (OHB) *305*
5.10.1 Overhanging beam with point load at each end *305*
5.10.2 Overhanging beam with UDL over entire span *305*
VTU Question Papers ***336***

6. BENDING STRESSES IN BEAMS **345–397**

6.1 Introduction *345*
6.2 Pure bending *345*
6.3 Assumptions in theory of simple bending *346*
6.4 Bending stress equation or pure bending derivation of Bernoulli's equation *347*
6.5 Relation between moment of resistance and radius of curvature *348*
6.6 Section modulus (*Z*) *349*
6.7 Definitions *350*
Circular section *351*
Square cross-section *355*
Rectangular cross-section *361*
T-section *371*
I-section *377*
C-section *387*
Angles *391*
VTU Question Papers ***391***

7. SHEAR STRESSES IN BEAMS **398–450**

7.1 Introduction *398*
7.2 Shear stress distribution in a loaded beam *399*
7.3 Shear stress distribution in a rectangle *401*
7.4 Shear stress distribution in an I-section *402*
